Chapter 8

Multi-Dimensional Arrays

Programming I --- Ch. 8

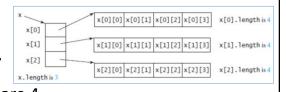

Objectives

- To represent data using two-dimensional arrays
- To declare variables for two-dimensional arrays, create arrays, and access array elements in a two-dimensional array using row and column indexes
- To use multidimensional arrays

Programming I --- Ch. 8

Two-dimensional array: introduction

- A two-dimensional array is an array of one-dimensional arrays.
- Whereas the elements of a one-dimensional array are indexed by a single integer, the elements of a two-dimensional array are indexed by a pair of integers:
 - the first index specifies the row, and
 - the second index specifies the column.
- Suppose int[][] x = new int[3][4], x[0], x[1], and x[2] are one-dimensional arrays and each contains four elements, as shown in the figure x.length is 3, and x[0].length, x[1].length, and x[2].length are 4.

Programming I --- Ch. 8

3

Two-dimensional array: example

- Data in a table or a matrix can be represented using a two-dimensional array.
- For example, the following table that lists the distances between cities can be stored using a two-dimensional array named **distances**.

	Distance Table (in miles)						
	Chicago	Boston	New York	Atlanta	Miami	Dallas	Houston
Chicago	0	983	787	714	1375	967	1087
Boston	983	0	214	1102	1763	1723	1842
New York	787	214	0	888	1549	1548	1627
Atlanta	714	1102	888	0	661	781	810
Miami	1375	1763	1549	661	0	1426	1187
Dallas	967	1723	1548	781	1426	0	239
Houston	1097	19/12	1627	810	1197	220	0

```
double[][] distances = {
    {0, 983, 787, 714, 1375, 967, 1087},
    {983, 0, 214, 1102, 1763, 1723, 1842},
    {787, 214, 0, 888, 1549, 1548, 1627},
    {714, 1102, 888, 0, 661, 781, 810},
    {1375, 1763, 1549, 661, 0, 1426, 1187},
    {967, 1723, 1548, 781, 1426, 0, 239},
    {1087, 1842, 1627, 810, 1187, 239, 0},
};
```

 An element in a two-dimensional array is accessed through a row and column index.

Programming I --- Ch. 8

(1) Declaring Reference Variables of Two-**Dimensional Arrays**

- The syntax for declaring a two-dimensional array is:
 - elementType[][] arrayRefVar; or
 - elementType arrayRefVar[][]; // Allowed, but not preferred
- As an example, here is how you would declare a two-dimensional array variable **matrix** of **int** values:

int[][] matrix;

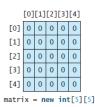

Programming I --- Ch. 8

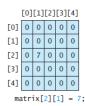

(2) Creating Two-Dimensional Arrays

- To assign elements to an array, you have to create it.
- You can create a two-dimensional array of 5-by-5 int values and assign it to matrix:

matrix = new int[5][5];

• To assign the value 7 to a specific element at row 2 and column 1, you can use: matrix[2][1] = 7;

• It is a common mistake to use matrix[2, 1] to access the element at row 2 and column 1. In Java, each subscript must be enclosed in a pair of square brackets.

Programming I --- Ch. 8

Array initializer

- You can also use an array initializer to declare, create, and initialize a two-dimensional array.
- For example, the following code in (a) creates an array with the specified initial values, which is equivalent to the code in (b).

```
int[][] array = {
                                      int[][] array = new int[4][3];
  {1, 2, 3},
                                      array[0][0] = 1; array[0][1] = 2; array[0][2] = 3;
  {4, 5, 6},
                                      array[1][0] = 4; array[1][1] = 5; array[1][2] = 6;
                         Equivalent
  {7, 8, 9},
                                      array[2][0] = 7; array[2][1] = 8; array[2][2] = 9;
                                      array[3][0] = 10; array[3][1] = 11; array[3][2] = 12;
  {10, 11, 12}
};
         (a)
                                                                   (b)
                [0][1][2]
             [0] 1 2 3
             [1] 4 5 6
             [2] 7 8 9
             [3] 10 11 12
                                         Programming I --- Ch. 8
```

Ragged Arrays

triangleArray[4][0] = 45;

- Each row in a two-dimensional array is itself an array. Thus, the rows can have different lengths. {1, 2, 3, 4, ! {2, 3, 4, 5}, {3, 4, 5}, {4, 5}, {5}
- An array of this kind is known as a ragged array. The figure is an example of creating such a ragged array.
- You can create a ragged array using the following syntax:

```
int[][] triangleArray = new int[5][];
triangleArray[0] = new int[5];
triangleArray[1] = new int[4];
triangleArray[2] = new int[3];
triangleArray[3] = new int[2];
triangleArray[4] = new int[1];
```

The syntax **new int[5][]** for creating an array requires the first index to be specified. The syntax new int[][] would be wrong.

 You can now assign values to the array. For example, triangleArray[0][3] = 50;

Programming I --- Ch. 8

8

1 2 3 4 5

2 3 4 5

3 4 5

Processing Two-Dimensional Arrays

- Nested for loops are often used to process a two-dimensional array.
- Suppose an array matrix is created as follows: int[][] matrix = new int[10][10];
- The following are some examples of processing two-dimensional arrays.
 - 1. *Initializing arrays with input values.* The following loop initializes the array with user input values:

```
java.util.Scanner input = new Scanner(System.in);
System.out.println("Enter " + matrix.length + " rows and " +
matrix[0].length + " columns: ");
for (int row = 0; row < matrix.length; row++) {
   for (int column = 0; column < matrix[row].length; column++) {
     matrix[row][column] = input.nextInt();
   }
}</pre>
```

Programming I --- Ch. 8

9

Processing Two-Dimensional Arrays (cont'd)

2. Summing all elements. Use a variable named total to store the sum. Initially total is **0**. Add each element in the array to **total** using a loop like this:

```
int total = 0;
for (int row = 0; row < matrix.length; row++) {
   for (int column = 0; column < matrix[row].length; column++) {
      total += matrix[row][column];
   }
}</pre>
```

3. Which row has the largest sum? Use variables maxRow and indexOfMaxRow to track the largest sum and index of the row. For each row, compute its sum and update maxRow and indexOfMaxRow if the new sum is greater.

Attempt to implement this on your own before looking into the textbook for suggested solution (pg. 294).

Programming I --- Ch. 8

Case Study: Grading a Multiple-Choice Test

- The problem is to write a program that will grade multiple-choice tests.
- Assume there are eight students and ten questions, and the answers are stored in a two-dimensional array. Each row records a student's answers to the questions, as shown in the following array, and the key is stored in a one-dimensional array.

```
Students' Answers to the Questions:
                 0 1 2 3 4 5 6 7 8 9
                                                                           Key to the Questions:
                ABACCDEEAD
Student 0
                                                                           0 1 2 3 4 5 6 7 8 9
                D B A B C A E E A D E D D A C B E E A D
Student 1
Student 2
                                                                       Key D B D C C D A E A D
                C B A E D C E E A D
A B D C C D E E A D
Student 4
                B B E C C D E E A D
B B A C C D E E A D
Student 5
Student 6
                EBECCDEEAD
Student 7
                                                     Programming I --- Ch. 8
```

Case Study: Grading a Multiple-Choice Test

- Your program grades the test and displays the result.
- It compares each student's answers with the key, counts the number of correct answers, and displays it.

Student 0's correct count is 7
Student 1's correct count is 6
Student 2's correct count is 5
Student 3's correct count is 4
Student 4's correct count is 8
Student 5's correct count is 7
Student 6's correct count is 7
Student 7's correct count is 7

 Read the case study on "Finding the Closest Pair" and Sudoku for more examples on twodimensional arrays.

```
LISTING 8.2 GradeExam.java
                   1 public class GradeExam {
                          public static void main(String[] args) {
   // Students' answers to the questions
                             char[][] answers = {
                  11
                  13
                  15
                  17
                             for (int i = 0; i < answers.length; i++) {
   // Grade one student</pre>
                  19
                                // dade of sadent
int correctCount = 0;
for (int j = 0; j < answers[i].length; j++) {
    if (answers[i][j] == keys[j])
                  21
                  23
                  24
                                     correctCount++;
                                System.out.println("Student " + i + "'s correct count is " +
                  27
                                   correctCount):
                  29

```

Multidimensional Arrays

- In Java, you can create *n*-dimensional arrays for any integer *n*.
- A multidimensional array is actually an array in which each element is another array. A three-dimensional array consists of an array of twodimensional arrays.
- A two-dimensional array consists of an array of one-dimensional arrays.
- For example, suppose x = new int[2][2][5],
 - x[0] and x[1] are two-dimensional arrays.
 - X[0][0], x[0][1], x[1][0], and x[1][1] are one-dimensional arrays and each contains five elements.
 - x.length is 2, x[0].length and x[1].length are 2, and
 - X[0][0].length, x[0][1].length, x[1][0].length, and x[1][1].length are 5.

Programming I --- Ch. 8

13

Multidimensional Arrays (cont'd)

- The way to declare two-dimensional array variables and create two-dimensional arrays can be generalized to declare n-dimensional array variables and create n-dimensional arrays for n >= 3.
- Syntax:

Programming I --- Ch. 8

Multidimensional Arrays (cont'd)

For example, you may use a three-dimensional array to store exam scores for a class of six students with five exams, and each exam has two parts (multiple-choice and essay). The following syntax declares a three-dimensional array variable scores, creates an array, and assigns its reference to scores.
 double[][][] scores = new double[6][5][2];

 You can also use the short-hand notation to create and initialize the array as follows:

- scores[0][1][0] refers to the multiple-choice score for the first student's second exam, which
 is 9.0.
- scores[0][1][1] refers to the essay score for the first student's second exam, which is 22.5.

Programming I --- Ch. 8

15

Chapter Summary

- A two-dimensional array can be used to store a table.
- A variable for two-dimensional arrays can be declared using the syntax: elementType[][] arrayVar.
- A two-dimensional array can be created using the syntax: new elementType [ROW_SIZE][COLUMN_SIZE]
- Each element in a two-dimensional array is represented using the syntax: arrayVar[rowIndex][columnIndex].
- You can create and initialize a two-dimensional array using an array initializer with the syntax: elementType[][] arrayVar = {{row values}, ..., {row values}}
- You can use arrays of arrays to form multidimensional arrays. For example, a variable for three-dimensional arrays can be declared as elementType[][][] arrayVar, and a three-dimensional array can be created using new elementType[size1][size2] [size3].

Programming I --- Ch. 8

Exercises

- Declare an array reference variable for a two-dimensional array of int values, create a 4-by-5 int matrix, and assign it to the variable.
- For each of the statement below, state whether it is valid or not.
 - int[][] r = new int[2];
 - int[] x = new int[];
 - int[][] y = new int[3][];
 - int[][] z = {{1, 2}};
 - int[][] m = {{1, 2}, {2, 3}};
 - int[][] n = {{1, 2}, {2, 3}, };

Programming I --- Ch. 8

17

Exercises

• What is the output of the following programs?

```
int[][] array = {{1, 2}, {3, 4}, {5, 6}};
int sum = 0;
for (int i = 0; i < array.length; i++)
    sum += array[i][0];
System.out.println(sum);</pre>
```

```
int[][][] array = {{{1, 2}, {3, 4}}, {{5, 6},{7, 8}}};
System.out.println(array[0][0][0]);
System.out.println(array[1][1][1]);
```

- Declare an array variable for a three-dimensional array, create a 4 * 6 * 5 int array, and assign its reference to the variable.
- Assume char [][][] x = new char[12][5][2],
 - How many elements are in the array?
 - What are x.length, x[2].length, and x[0][0].length?

Programming I --- Ch. 8
