# Steps to import a Java class into a project

File→ Import… → General → File System

- In the following dialog box, specify where to get the source file, and confirm the destination folder to hold the file.
- When done, click "Finish" to complete the import.

Steps to open an existing project copied from another source

- Use File→ Open Projects From File System
  This works for Eclipse projects with .project descriptor

- Use its **Import** function
  File→ Import… → General → Existing projects into Workspace, then select the radio option: *Select root directory* and specify the project's directory path.
